

Project 3: New Fiancé? We Finance! Testing

There were 20 test cases. Each test was worth 6.5 points; to run the test cases:

For the first 15 test cases:

1. Remove the main routine from your `anagrams.cpp` file.
2. Change the value of your constant `MAXDICTWORDS` to be 10.
3. Append the following text to the end of your `anagrams.cpp` file and build the resulting program.
4. For any test case you wish to try, run the program, providing as input the test number.

```
#include <iostream>
#include <fstream>
#include <sstream>
#include <string>
#include <cassert>
#include <algorithm>

using namespace std;

void testone(int n)
{
    string dictionary[MAXDICTWORDS];
    string results[MAXRESULTS];

    switch (n)
    {
        default: {
            cout << "Bad argument" << endl;
        } break; case 1: {
            istringstream
iss("dog\ncat\nrat\nneel\ntar\nart\nlee\nact\nngod");
            int numResults = makeDictionary(iss, dictionary);
            sort(dictionary, dictionary + numResults);
            assert(numResults == 9 && dictionary[0] == "act" &&
dictionary[1] == "art");
        } break; case 2: {
            // File is empty, checks that file is empty and
makeDictionary returns 0.
            istringstream iss("");
            int numResults = makeDictionary(iss, dictionary);
            assert(numResults == 0 && dictionary[0] == "");
        } break; case 3: {
            // Dictionary has been read properly
```

```

        istringstream

        int numResults = shuffleChars("look", example, 3,
results);
        assert(numResults == 1 && results[0] == "kool");
    } break;
    }
}

int main()
{
    cout << "Enter test number: ";
    int n;
    cin >> n;
    testone(n);
    cout << "Passed" << endl;
}

```

For the final 5 test cases:

1. Rename wordsMax.txt to be words.txt.
2. Run the test code on the SEASnet server. Make sure that anagrams.cpp and words.txt are in the same directory.
3. Replace your main program with that from testmain.cpp.
4. Run g32 in this fashion: g32 anagrams.cpp -DTEST# (where #, is 1, 2, 3, 4, or 5)

```

#include <iostream>
#include <fstream>
#include <istream>
#include <cstring>
#include <cassert>
using namespace std;

const int MAXRESULTS = 20; // Max matches that can be found
const int MAXDICTWORDS = 30000; // Max words that can be read in

```

```
int main()
{
    string results[MAXRESULTS];
    string dict[MAXDICTWORDS];
    ifstream dictfile;           // file containing the list of
words
    int nwords;                  // number of words read from
dictionary
    string word;

    dictfile.open("words.txt");
    if (!dictfile) {
        cout << "File not found!" << endl;
        return (1);
    }

    nwords = makeDictionary(dictfile, dict);

#ifdef TEST1
    word = "rat";
#endif
#ifdef TEST2
    word = "babe";
#endif
#ifdef TEST3
    word = "plane";
#endif
#ifdef TEST4
    word = "maiden";
#endif
#ifdef TEST5
